Abstract

Cosmology is a branch of astronomy that involves the origin and evolution of the universe, from the Big Bang to today and on into the future. According to NASA, the definition of cosmology is the scientific study of the large scale properties of the universe as a whole.

Cosmology is branch which deals with origin of universe. It includes all the facts related to universe like fate of universe , development of galaxies , matter and many space related facts. Cosmology is indulged in astronomy, physics, and chemistry, among many other related fields. Cosmologists construct and refine theoretical models that encompass and

describe the observable, physical universe. Almost 13.8 billion year ago, cosmic explosion happened, due to which universe is rapidly inflated and then cooled but is still expanding at increasing rate.
